

ABSTRACT

When a commodity is ordered at a terminal, customer information stored in advance is displayed on a terminal, and the order is accepted when the displayed customer information is designated. Where the customer information stored in advance includes a plurality of pieces of information for each item, one of the pieces of customer information is selected, and the selected customer information is used to accept the order. When it is tried to use a customer information different from the customer information displayed on the terminal to order a commodity, if desired customer information is entered, then the entered customer information is used to accept the order. The entered customer information is stored as additional information to the customer information stored in advance and is displayed on the terminal and used as an object of selection upon later ordering.
